1. INTRODUCTION

Ecology and Environment, Inc., Field Investigation Team (FIT) was tasked by the United States Environmental Protection Agency (U.S. EPA) to conduct a screening site inspection (SSI) of the U.S. Steel Corporation, Joliet Works (USSJW) site under contract number 68-01-7347.

The site was initially discovered by the Illinois Environmental Protection Agency (IEPA) on March 5, 1973, following an inspection of the facility that discovered that the facility had been operating without a proper air emissions permit (IEPA 1976).

The site was evaluated in the form of a preliminary assessment (PA) that was submitted to U.S. EPA. The PA was prepared by Richard Lange of IEPA and is dated September 7, 1984.

FIT prepared an SSI work plan for the (USSJW) site under technical directive document (TDD) F05-8703-410, issued on March 23, 1987. The SSI work plan was approved by U.S. EPA on May 12, 1989. The SSI of the USSJW site was conducted on October 25, 1989, under TDD F05-8905-029, issued on May 12, 1989.

The FIT SSI included an interview with site representatives, a reconnaissance inspection of the site, and the collection of eight soil/sediment samples.

The purposes of an SSI have been stated by U.S. EPA in a directive outlining Pre-Remedial Program strategies. The directive states:

All sites will receive a screening SI to 1) collect additional data beyond the PA to enable a more refined preliminary HRS [Hazard Ranking System] score, 2) establish priorities among sites most likely to qualify for

the NPL [National Priorities List], and 3) identify the most critical data requirements for the listing SI step. A screening SI will not have rigorous data quality objectives (DQOs). Based on the refined preliminary HRS score and other technical judgement factors, the site will then either be designated as NFRAP [no further remedial action planned], or carried forward as an NPL listing candidate. A listing SI will not automatically be done on these sites, however. First, they will go through a management evaluation to determine whether they can be addressed by another authority such as RCRA [Resource Conservation and Recovery Act].... Sites that are designated NFRAP or deferred to other statutes are not candidates for a listing SI.

The listing SI will address all the data requirements of the revised HRS using field screening and NPL level DQOs. It may also provide needed data in a format to support remedial investigation work plan development. Only sites that appear to score high enough for listing and that have not been deferred to another authority will receive a listing SI. (U.S. EPA 1988).

U.S. EPA Region V has also instructed FIT to identify sites during the SSI that may require removal action to remediate an immediate human health or environmental threat.

2. SITE BACKGROUND

2.1 INTRODUCTION

This section presents information obtained from SSI work plan preparation, the site representative interview, and a reconnaissance inspection of the site.

2.2 SITE DESCRIPTION

The USSJW site consists of approximately 180 acres and contains an active wire mill and approximately 20 other buildings. The site is located at 927 Collins Street, Joliet, Illinois, in Will County (SW1/4 sec. 3, NW1/4 sec. 10, T.35N., R.10E.). The site is bordered on the east and south by residential areas, on the west by the Illinois and Michigan Sanitary (I & M) Canal and the Des Plaines River, and on the north by the Joliet Correctional Center (see Figure 2-1 for site location).

A 4-mile radius map of the USSJW site is provided in Appendix A.

2.3 SITE HISTORY

The USSJW site is currently divided into 11 lots of various sizes (see Figure 2-2 for site property divisions). USX Corporation (USX) owns four lots and a portion of a fifth. These lots include lot 2 (approximately 6 acres), lot 8 (approximately 5 acres), lot 6 (approximately 49 acres), lot 11 (approximately 26 acres), and a portion of lot 4 (approximately 1/2 acre of the total 3 acres). American Steel & Wire Corporation (AS&W) of Cuyahoga Heights, Ohio, owns three lots, including lot 5 (approximately 10 acres), lot 7 (approximately 42 acres), and lot 9 (approximately 2 acres). Lot 7 and the majority of

FIGURE 2-2 SITE PROPERTY DIVISIONS

lot 5 were purchased in 1986, and lot 9 and the remaining portion of lot 5 were purchased from USX in 1989. The remaining four lots are owned by four separate companies. Lot 1 (approximately 31 acres) is owned by a private realty company and was purchased in 1989. Lot 3 (approximately 1 acre) is owned by Graphics Paper of Joliet, and was purchased in 1988. The majority of lot 4 is owned by Webster Warehouse II, Inc., of Joliet, and was purchased in 1988. Lot 10 (approximately 1/2 acre) is owned by the Joliet Federal Credit Union and was purchased from USX in 1989 (Zaborske 1989).

U.S. Steel Corporation (USS) had owned the entire site since at least the 1860s, when a steel plant was constructed on-site (IEPA 1975a; Moniot 1989). USS became a part of USX in July 1986, and the site was divided into lots and put up for sale by USX (Zaborske 1989). Prior to the sale of any of the property, a site assessment was conducted by Engineering Science, Inc. (ES), an environmental consulting company from Oak Brook, Illinois. The assessment found only one area of contamination on-site, an old drum storage area located on the north-central portion of lot 7, where waste solvents had been stored. ES excavated an unknown quantity of the contaminated soil from this area from the end of 1988 to early 1989 (Moniot 1989).

AS&W currently operates a wire mill (the "facility") and a wastewater treatment plant (WWTP) on its portion of the site. The company uses steel billets (4 inches by 4 inches by 34 feet), which are produced by other companies and trucked to the facility, to produce a variety of fasteners (Keltz 1989). The billets are run through a reheating furnace and drawn into steel rods, ground, and cut to appropriate sizes before the final product is produced (Price 1989).

Waste that is currently produced by AS&W includes used industrial oils and lubricants, sludge from the WWTP, swarf (steel sawdust), and scale (small flakes of steel). According to site representatives, none of this waste is considered hazardous. The waste industrial oils and lubricants, the swarf, and the scale are all sold to off-site companies. The WWTP sludge is landfilled off-site as a special waste. All wastewater produced is recycled in the facility process (Price 1989).

AS&W has three operating permits that were passed on to it from USX following AS&W's purchase of its portion of the site and the facility.

These permits include National Pollutant Discharge Elimination System (NPDES) permit number IL0002674 for the discharge of cooling tower blowdown into the Des Plaines River, air emissions permit number 197045 ABT for operating emission sources and air pollution equipment, and city of Joliet permit number J1500 for domestic sewage (Keltz 1989).

Graphic Paper and Webster Warehouse II both have small storage buildings on their portions of the site. Contents stored in these are unknown. There are no current operations on the lots owned by the private realty company or the Joliet Federal Credit Union (Zaborske 1989).

USS operated a steel plant on-site from the 1860s until the 1930s. A variety of steel products were manufactured during this period (Moniot 1989). Wire production was introduced to the site in the 1940s, which involved the production of rods, wire, woven fence, barbed wire, nails, concrete reinforcing mesh, and other miscellaneous wire products (IEPA 1975b). The USS wire facility operated until AS&W took over the facility; however, production decreased greatly from 1979 to 1986 (Moniot 1989).

USS was granted a permit by IEPA to construct the WWTP in March 1970. Construction was completed and the WWTP was put into operation in December 1971 (IEPA 1975a). In March 1974, USS was given permission by IEPA to bypass the WWTP in order to install the final phases of their plant upgrading. Company officials had informed the IEPA that the upgrading would be completed within one week. During the period that the WWTP was bypassed, wastewater was discharged directly into Penitentiary Ditch, which runs through the site before entering the Des Plaines River (IEPA 1974). Wastewater was routinely discharged to Penitentiary Ditch prior to construction of the WWTP (IEPA 1975a). IEPA officials visited the site during the period that the WWTP was bypassed and observed an oily iridescence and black, oil-like globules on the surface of the ditch. A water sample was collected from the ditch at the point of entry of USS's wastewater flow. The sample was analyzed and found to contain low concentrations of heavy metals, the primary contaminants analyzed for (IEPA 1974). USS received NPDES permit number IL0002674 in September 1974 for discharge of the WWTP effluent into I & M Canal (IEPA 1985b). Currently, the WWTP discharges only

blowdown from the cooling system portion of the facility; this discharge occurs approximately once a month. Wastewater is now recycled in the facility (Keltz 1989; Price 1989).

In November 1980, USS submitted a RCRA Part A application for generation and storage of hazardous wastes on-site (U.S. EPA 1989). The primary hazardous waste generated was waste pickle liquor, which was produced from the process of cleaning iron rods. The waste was stored on-site in a 30,000-gallon storage tank prior to being shipped off-site (IEPA 1982). In April 1985, USS notified IEPA that the pickling operation had been discontinued and the facility was no longer generating or storing hazardous wastes (USS 1985). In January 1986, USS withdrew its application for a Part A permit for the facility (USS 1986).

A U.S. EPA Notification of Hazardous Waste Site form was submitted by USS for its Joliet Works facility in May 1981. The form identified a small landfill, of approximately 3,800 cubic feet, located on-site in which acids, used pickling liquor, and material from plant spills had been deposited from 1972 to 1980 (U.S. EPA 1981). Sludge from the WWTP was also disposed of in the landfill (Moniot 1989).

USS had a history of violations of U.S. EPA air emission standards during the 1970s and early 1980s. The violations involved operating a number of processes without proper operating permits, including nail galvanizing lines, steel grinders, and a cleaning house (IEPA 1974, 1975a, 1975b, 1976, 1985a). USS had applied for the required operating permits for these processes in 1974 and again in 1975, but the applications were denied by IEPA because of an excessive amount of potential particulate release from these processes (IEPA 1976). IEPA officials also observed air emission violations during site inspections. These violations included dense black smoke emitted from one of the operating splice bar mills (where splices for railroad tracks were produced), excessive particulates emitted from the galvanizing lines, and excessive sulfuric acid emitted from the cleaning house (IEPA 1974, 1975a, 1975b, 1975c). A complaint against USS for violating air pollution regulations was filed with the Illinois Pollution Control Board (IPCB) in 1975 by the State of Illinois and U.S. EPA (IPCB 1975). No additional information on these or other violations is known to FIT.

An IEPA inspection of the AS&W operations at the site in July 1987 found that the facility was in compliance with current operating permits (IEPA 1987). The IEPA Maywood Office does a compliance inspection for the air emissions permit and the NPDES permit once a year (Price 1989). According to state and federal file information, no regulatory actions involving the facility are currently pending.

3. SCREENING SITE INSPECTION PROCEDURES AND FIELD OBSERVATIONS

3.1 INTRODUCTION

This section outlines procedures and observations of the SSI of the USSJW site. Individual subsections address the site representative interview, reconnaissance inspection, and sampling procedures. Rationales for specific FIT activities are also provided. The SSI was conducted in accordance with the U.S. EPA-approved work plan, with only minor modifications in the proposed sample plan brought about by observations made during the site reconnaissance inspection. As stated in the proposed sample plan, eight soil samples were collected; however, all samples were collected at the surface instead of below the surface because of site observations made by FIT. FIT observed foundry sand and slag on-site. FIT believed these to be present at depth as well as at the surface. Also, only one potential background sample was collected, not two. The potential background sample was collected from an on-site location, rather than off-site as suggested in the work plan.

The U.S. EPA Potential Hazardous Waste Site Inspection Report (Form 2070-13) for the USSJW site is provided in Appendix B.

3.2 SITE REPRESENTATIVE INTERVIEW

Ted Nehrkorn, FIT team leader, conducted an interview with representatives from USX, USS, and AS&W, current and past owners and operators of the USSJW site. USX was represented by John M. Zaborske, Midwest Regional Manager for USX Realty Development. USS was represented by J. David Moniot, Director, Plant Environmental Projects and Environmental Affairs. AS&W was represented by Elaine A. Price,

Manager, Executive Programs, and Charles H. Keltz, Manager, Maintenance. The interview took place on October 25, 1989, at 10:00 a.m. in a conference room in the AS&W main office building. Also present at the interview was Jeffrey Dickson, of FIT. The interview was conducted to gather information that would aid FIT in conducting SSI activities.

3.3 RECONNAISSANCE INSPECTION

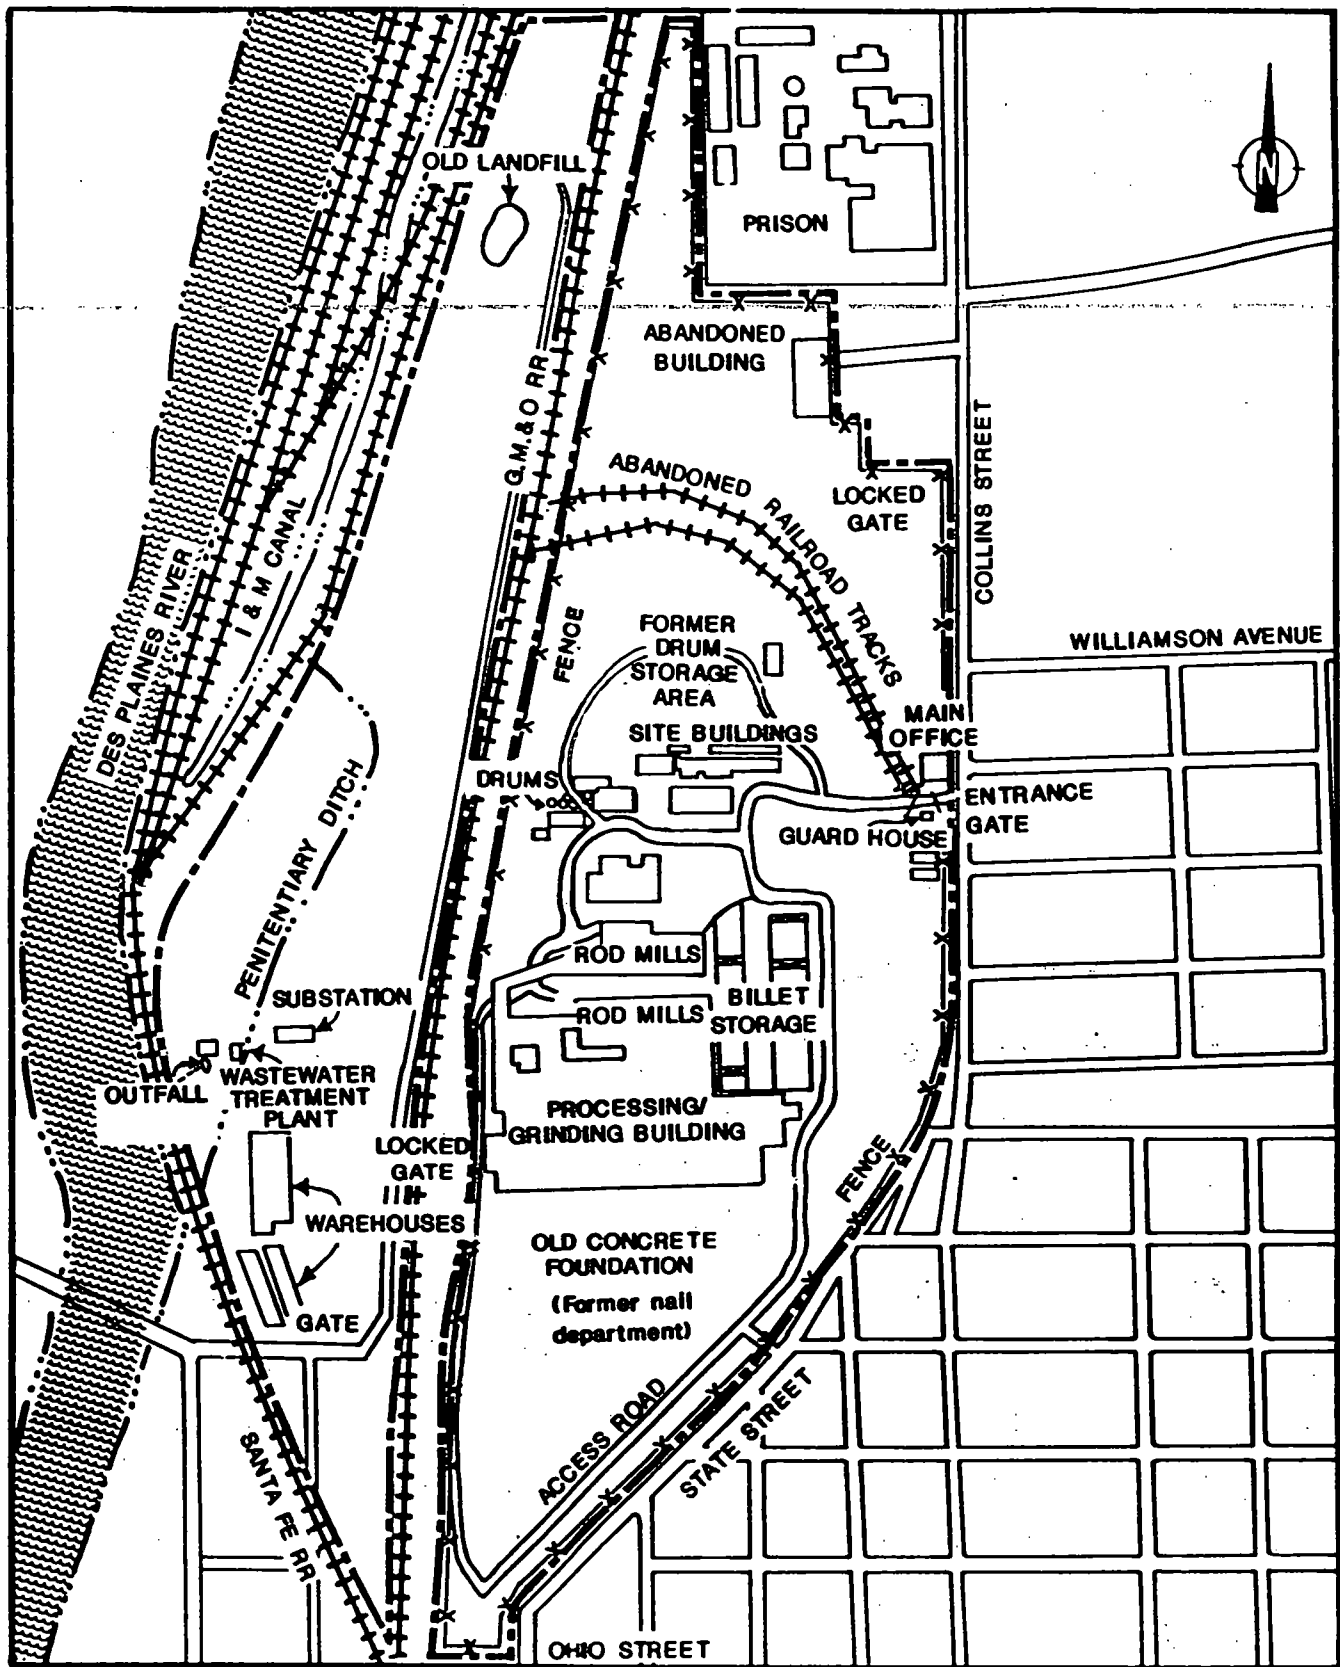

Following the site representative interview, FIT conducted a reconnaissance inspection of the USSJW site and surrounding area in accordance with Ecology and Environment, Inc. (E & E), health and safety guidelines. The reconnaissance inspection began at 11:40 a.m. and included a walk-through of the site to determine appropriate health and safety requirements for conducting on-site activities and to make observations to aid in characterizing the site. FIT also determined sampling locations during the reconnaissance inspection. FIT was accompanied by Zaborske, Moniot, Price, and Keltz during the reconnaissance inspection.

Reconnaissance Inspection Observations. The USSJW site is located on the east side of Joliet, Illinois. The site is bordered by the Joliet Correctional Center and commercial property to the north, Collins Street and State Street to the east, Ohio Street to the south, and a Santa Fe Railroad line, the Des Plaines River, and I & M Canal to the west (see Figures 3-1 and 3-2 for locations of site features and detail of the outfall area).

Active railroad lines owned by Chicago and Alton Railroad run north and south through the site, dividing the site into east and west portions. The east portion contains lot 1 and lots 7 through 11; the west portion contains lots 2 through 6 (see Figure 2-2).

The perimeter of the east portion of the site is completely fenced. Electrically controlled gates are located at the main entrance to the site and all other gates are locked (Keltz 1989).

Lot 1, the southernmost lot in the east portion, contains old concrete foundations. These foundations are the remains of the former USS nail production operation. The majority of lot 8 was occupied by concrete foundations, marking the location of the former USS splice bar mill.

SOURCE: Ecology and Environment, Inc. 1990.

FIGURE 3-1 SITE FEATURES

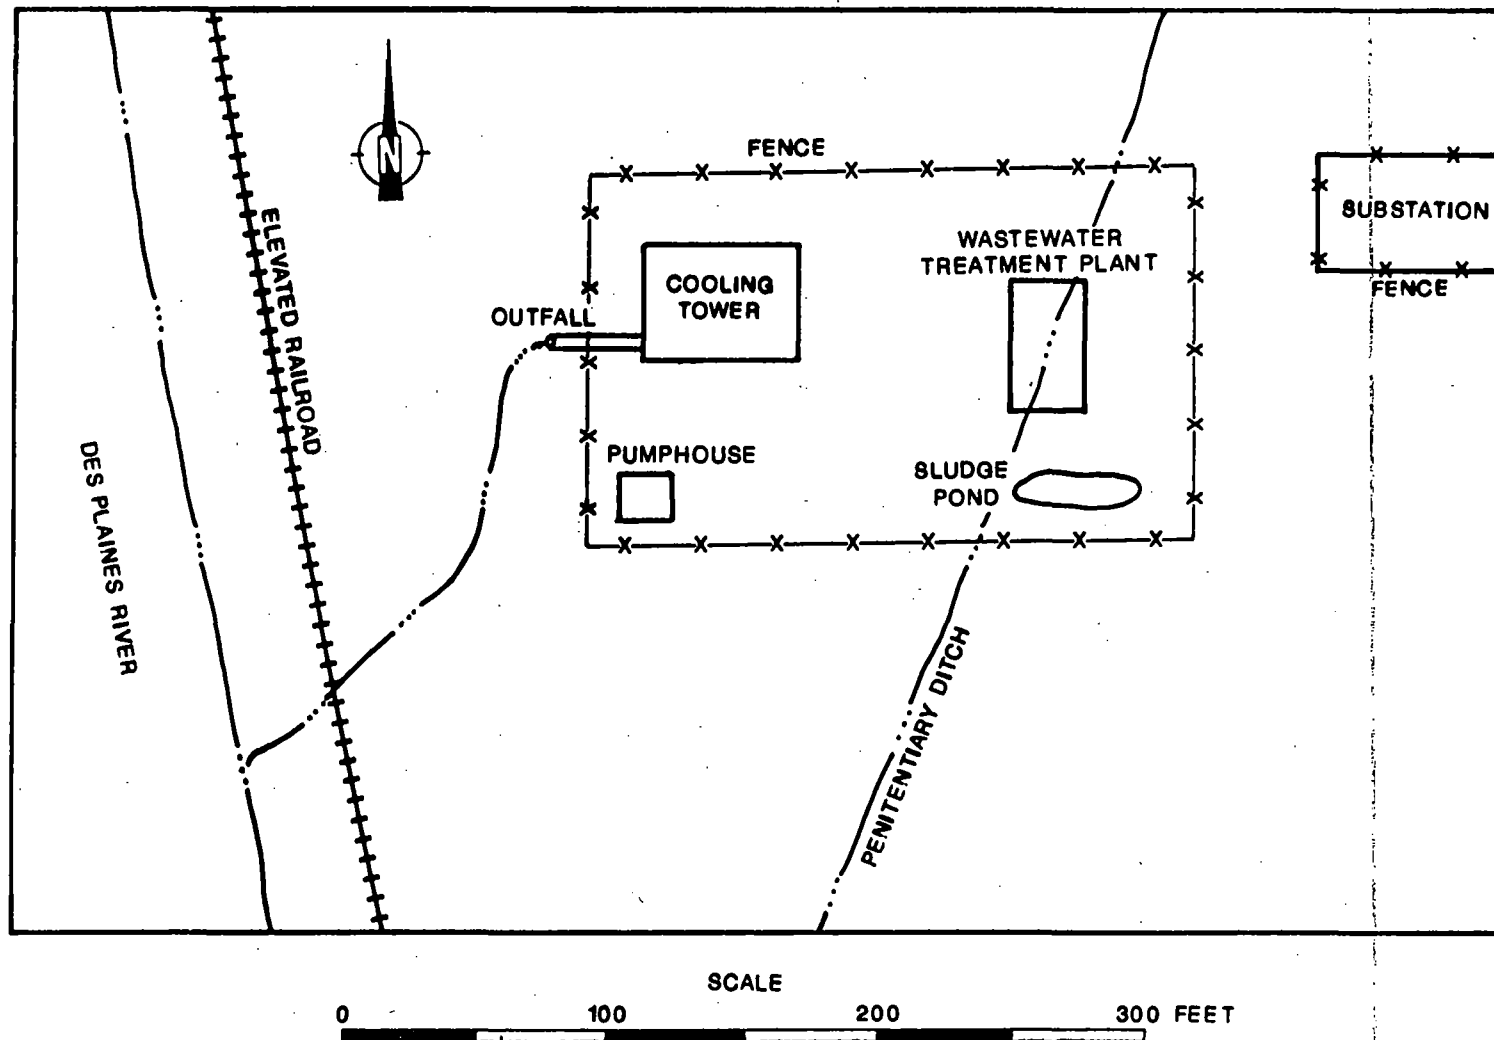

FIGURE 3-2 DETAIL OF OUTFALL AREA

Lots 7 and 9, located in the central part of the east portion, contain the active AS&W wire mill and the majority of the approximately 25 on-site buildings (Zaborske 1989). The main office building, which houses both AS&W and USX Realty Development offices, was the primary structure located on lot 9. A small guardhouse, where a security guard is present 24 hours a day, was located on lot 7 near the electronically controlled access gate. The process buildings were all located on lot 7. The process buildings included the rod mills and the billet process/grinding and storage building. The billet storage area was located east of the rod mills. A number of buildings used for a variety of plant operations were located north of the rod mills. Approximately 300 drums were observed on the west side of these buildings in an unpaved area. The majority of these drums were empty; however, some contained waste materials including scale, oils, lubricants, and synthetic hydraulic fluids. Some of these drums were tipped on their sides, and some material had leaked out onto the ground. The majority of this area of lot 7, excluding the area containing the drums, was paved. North of this area were dirt and grass. This area was the former drum storage area in which used waste solvents had been stored (Moniot 1989). A dirt road ran from the main on-site road starting at a point just east of the buildings, encircling the former drum storage area, to the west side of the buildings near the area containing the drums.

The majority of lot 11 was grass covered with a small tree line along the east side. The only structures observed on lot 11 were approximately three abandoned buildings. A number of abandoned railroad lines were also observed running through lot 11. Lot 10 did not have any structures, and was mostly grass covered.

The former landfill, the WTP and Penitentiary Ditch are all located on the west portion of the site. The landfill is located on the northern portion of lot 6. The landfill area was completely covered with vegetation.

The WTP is located on lot 5 and includes a treatment facility building and a cooling tower. A sludge pit containing treatment sludge is located just south of the treatment facility building. These facilities are completely surrounded by a fence with a locked gate. A

pump house used to pump water from the Des Plaines River is located inside the fence, south of the cooling tower. The outfall discharges into a small ditch which empties into I & M Canal.

Penitentiary Ditch is a water-containing ditch that runs from the central portion of lot 6, through lot 5, and discharges into the Des Plaines River in lot 4. The ditch was not continuous through the entire route, because the WWTP was built over the ditch. The water in the ditch upstream of the WWTP was green and did not appear to be flowing. The water downstream of the WWTP was muddy and also was not flowing. An underground tunnel leading from the direction of the wire mill facility connected to Penitentiary Ditch approximately 50 feet south of the WWTP. There did not appear to be anything being discharged into the ditch from this tunnel.

An electrical substation is located east of the WWTP facilities. The substation is completely surrounded by a fence with a locked gate, separate from the WWTP facilities. The fences surrounding the WWTP facilities and the substation were the only fences observed on the western portion of the site.

Warehouses were observed on lots 3 and 4. Site representatives did not know whether their warehouses were currently being used and if so, for what purposes. No structures were observed on lot 2. A dirt road ran along the eastern border of the west portion of the site from lot 2 to just north of the former landfill.

Photographs of the USSJW site are provided in Appendix C.

3.4 SAMPLING PROCEDURES

Samples were collected by FIT at locations selected during the reconnaissance inspection to determine whether U.S. EPA Target Compound List (TCL) compounds or Target Analyte List (TAL) analytes were present at the site. The TCL and TAL are included with corresponding quantitation/detection limits in Appendix D.

On October 25, 1989, FIT collected eight soil/sediment samples, including one potential background soil sample. Portions were offered to the site representatives and were accepted by AS&W but declined by USX (USS). The samples that were shared with AS&W were those collected from its property: samples S4, S5, S6, and S7.

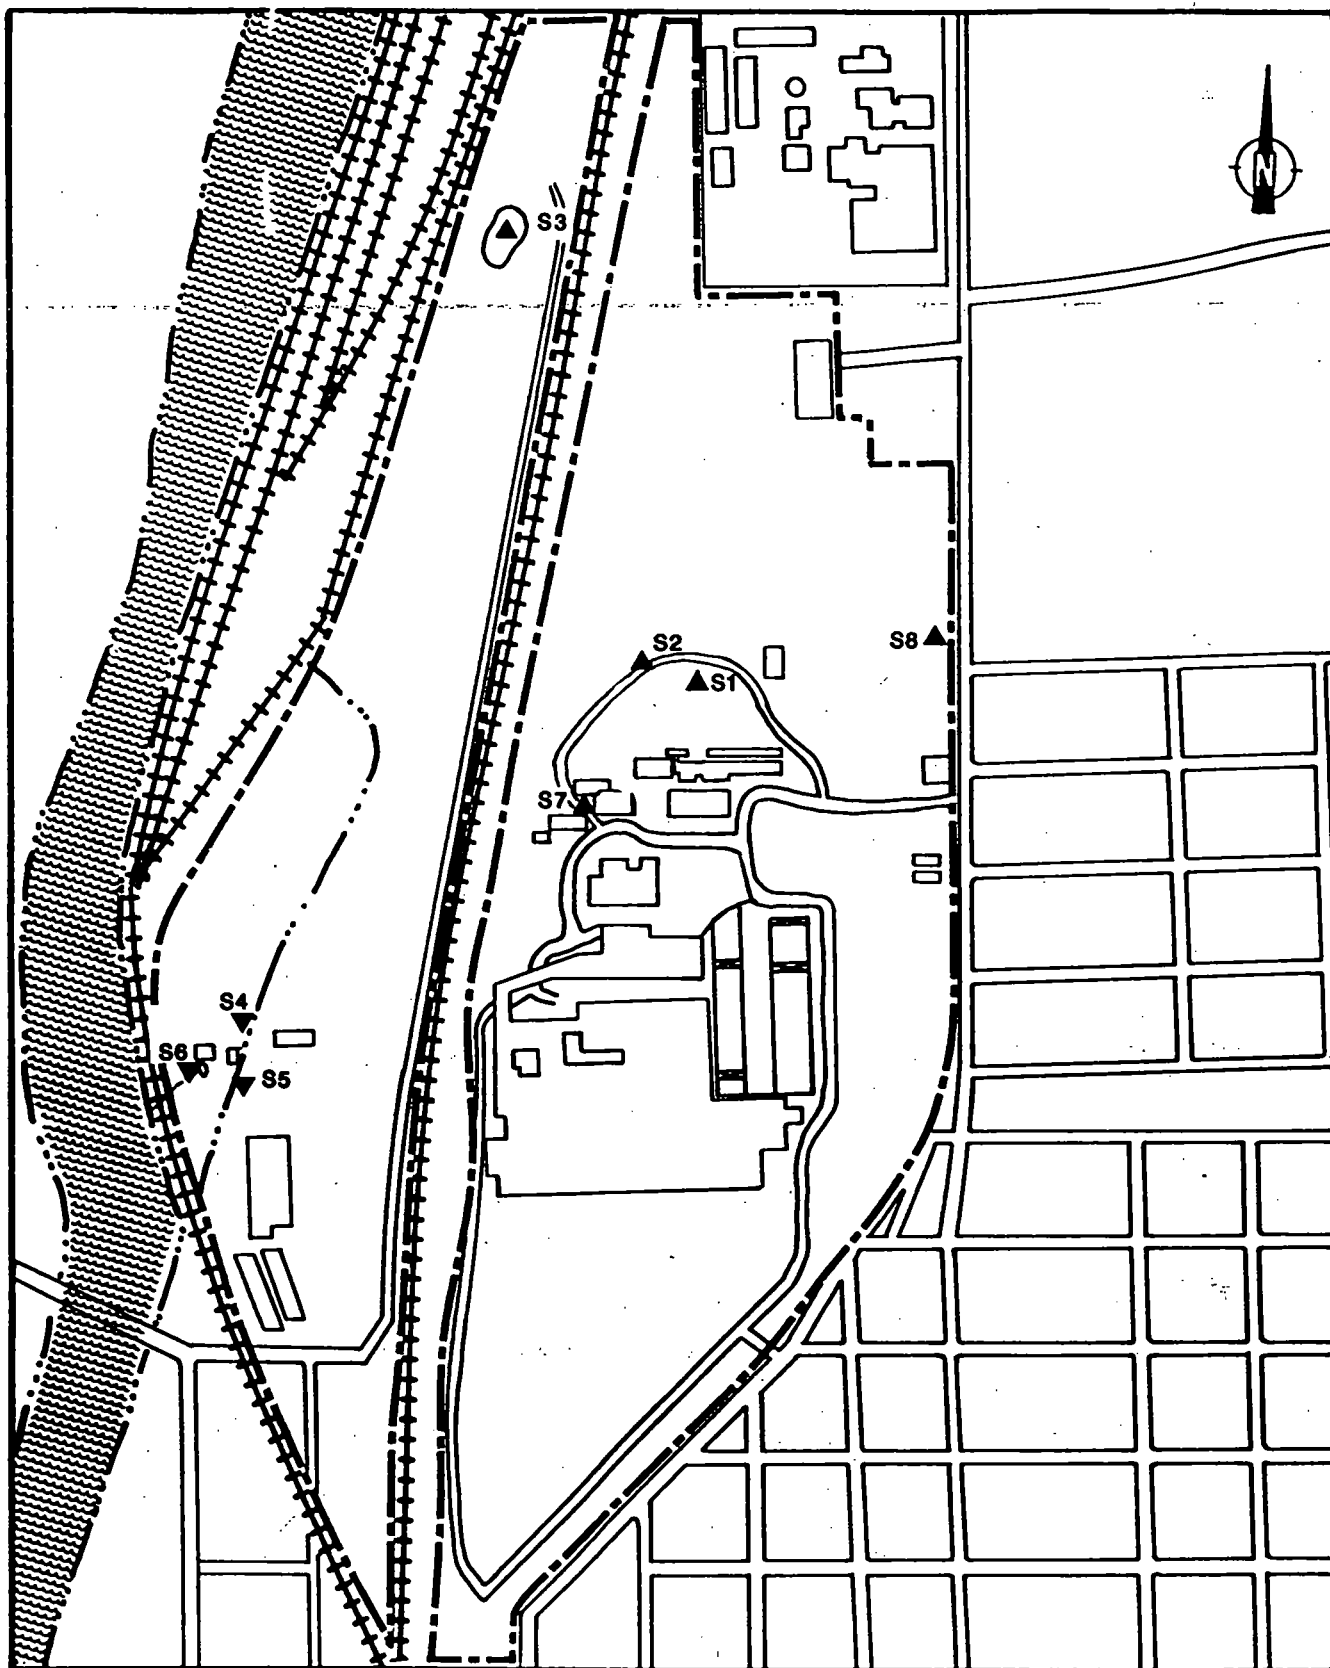

Soil/Sediment Sampling Procedures. Soil samples S1 and S2 were grab surface samples collected from the former drum storage area (see Figure 3-2 for soil/sediment sampling locations). These soil sampling locations were chosen to determine whether TCL compounds or TAL analytes were still present in the ground following the remedial work done at this location. Soil sample S3 was a grab surface sample collected from the former landfill. This sampling location was selected to determine whether TCL compounds or TAL analytes were present in the former landfill.

Samples S4, S5, and S6 were grab surface sediment samples. Sample S4 was collected from Penitentiary Ditch just upstream of the WWTP facility. This sampling location was chosen to determine the chemical characteristics of the ditch upstream from the former discharge point of the USS facility. Sample S5 was collected from Penitentiary Ditch downstream of the former discharge point. This sampling location was chosen to determine whether TCL compounds or TAL analytes were present in the ditch from past discharges by the facility. Sample S6 was collected near the outfall from the WWTP to the ditch. This sampling location was selected to determine whether TCL compounds or TAL analytes had been discharged from the facility.

Soil sample S7 was a surface soil sample collected from an area of stained soil near the drum storage area. This sampling location was selected to determine whether TCL compounds or TAL analytes had entered the ground in this area.

Soil sample S8, a potential background sample, was a grab surface soil sample collected in a wooded area along the eastern border of the east portion of the site. The sampling location was chosen because it appeared to be a relatively undisturbed area and no hazardous wastes were known to have been stored or disposed of in the vicinity. Sample S8 was collected to determine the representative chemical content of the soil in the area of the site.

Standard E & E decontamination procedures were adhered to during the collection of all soil/sediment samples. The procedures included the scrubbing of all equipment (e.g., trowels) with a solution of detergent (Alconox) and distilled water, and triple-rinsing the equipment with distilled water before the collection of each sample

LEGEND

▲ SOIL SAMPLE ▼ SEDIMENT SAMPLE

FIGURE 3-3 SOIL/SEDIMENT SAMPLING LOCATIONS

(E & E 1987). All soil/sediment samples were packaged and shipped in accordance with U.S. EPA-required procedures.

As directed by U.S. EPA, all soil/sediment samples were analyzed using the U.S. EPA Contract Laboratory Program (CLP) for TCL compounds by Southwest Laboratories of Oklahoma, of Broken Arrow, Oklahoma; and for TAL analytes by Weyerhaeuser of Federal Way, Washington.

4. ANALYTICAL RESULTS

4.1 INTRODUCTION

This section presents results of the chemical analysis of FIT-collected soil/sediment samples for TCL compounds and TAL analytes.

4.2 RESULTS OF CHEMICAL ANALYSIS OF FIT-COLLECTED SAMPLES

Soil/Sediment Samples. Chemical analysis of FIT-collected soil/sediment samples revealed substances from the following groups of TCL compounds and TAL analytes: halogenated hydrocarbons, aromatics, phenols, polyaromatic hydrocarbons (PAHs), aromatic amines, hydrocarbons, pesticides, heavy metals, metals, common laboratory artifacts (methylene chloride, acetone, and bis[2-ethylhexyl]phthalate), and soil constituents common to the area of the site; cyanide was also detected (see Table 4-1 for complete chemical analysis results of FIT-collected soil/sediment samples).

Quantitation/detection limits used in the analysis of soil/sediment samples are provided in Appendix D.

The analytical data for the chemical analysis of soil/sediment samples collected for this SSI have been reviewed by U.S. EPA and FIT for compliance with terms of the FIT contract, and the review has been approved by U.S. EPA. Any additions, deletions, or changes to the data have been incorporated in the chemical analysis results tables presented in this section.

Table 4-1 (Cont.)

COMPOUND QUALIFIER	DEFINITION	INTERPRETATION
J	Indicates an estimated value.	Compound value may be semiquantitative.
ANALYTE QUALIFIERS	DEFINITION	INTERPRETATION
E	Estimated or not reported due to interference. See laboratory narrative.	Analyte or element was not detected, or value may be semiquantitative.
N	Spike recoveries outside QC protocols, which indicates a possible matrix problem. Data may be biased high or low. See spike results and laboratory narrative.	Value may be quantitative or semiquantitative.
+	Correlation coefficient for standard additions is less than 0.995. See review and laboratory narrative.	Data value may be biased.
B	Value is real, but is above instrument DL and below CRDL.	Value may be quantitative or semiquantitative.
J	Value is above CRDL and is an estimated value because of a QC protocol.	Value may be semiquantitative.
M	Duplicate injection precision not met.	Value may be semiquantitative.
W	Post-digestion spike for furnace AA analysis is out of control limits (35-115%), while sample absorbance is <50% of spike absorbance.	Value may be semiquantitative.

5. DISCUSSION OF MIGRATION PATHWAYS

5.1 INTRODUCTION

This section presents discussions of data and information pertaining to potential migration pathways and targets of TCL compounds and TAL analytes that are possibly attributable to the USSJW site.

The five migration pathways of concern discussed are groundwater, surface water, air, fire and explosion, and direct contact.

5.2 GROUNDWATER

Groundwater sampling was not conducted at the USSJW site because no wells are located downgradient of the site. Groundwater flow is assumed to be west toward the Des Plaines River.

However, a potential exists for TCL compounds and TAL analytes to migrate from the site to groundwater in the vicinity of the site. A number of on-site factors exist that increase the potential for the migration to occur, including the following.

- A large number of TCL compounds, including trichloroethene, toluene, phenol, a number of pesticides, and a number of PAHs were detected in on-site soil/sediment samples at concentrations greater than in the background sample, S8.
- A large number of TAL analytes were detected at elevated concentrations in on-site soil/sediment samples, including the background sample.

- There does not appear to be any type of low permeability material protecting the aquifer of concern (AOC). The absence of such material may allow the TCL compounds and TAL analytes detected on-site to migrate to groundwater in the vicinity.

Chemical analysis of the FIT-collected on-site soil/sediment samples revealed the presence of a number of TCL compounds at concentrations above concentrations in the background sample. Samples containing elevated concentrations include soil samples S1 and S2, collected from the former drum storage area, where remedial cleanup had already been completed according to the site representative (Moniot 1989). Elevated concentrations were also detected in soil sample S7, collected from the present drum storage area; in sediment sample S5, collected from Penitentiary Ditch; and in sediment sample S6, collected near the WWTP outfall structure.

A review of area well logs and geologic literature of the area surrounding the USSJW site indicates the presence of three major underground water-bearing units. The three aquifers, in descending order, are: a sand and gravel Quaternary drift deposit, a Silurian dolomite bedrock formation, and a sequence of hydraulically connected formations of dolomites and sandstones of Ordovician and Cambrian age, collectively called the Cambrian-Ordovician aquifer system (Woller and Sanderson 1983).

The Maquoketa shale formation, a known aquitard, lies between the Silurian dolomite bedrock formation and the Cambrian-Ordovician aquifer system (Woller and Sanderson 1983).

The Quaternary drift deposit ranges in thickness from 1 to 112 feet, and is composed of interbedded till units, lacustrine clay deposits, and water-bearing outwash units of sand and gravel. The Silurian dolomite formation ranges in thickness from 155 to 315 feet. The Maquoketa shale formation ranges in thickness from 80 to 250 feet. The Cambrian-Ordovician aquifer system is found at depths ranging from 260 to 575 feet (Appendix E; Woller and Sanderson 1983).

The Quaternary drift aquifer and the Silurian dolomite aquifer appear to be hydraulically connected because of the lack of a confining

layer separating the two units, and together form the AOC (Woller and Sanderson 1983).

The AOC is the primary water-bearing formation utilized by private residential wells in the vicinity of the site (Woller and Sanderson 1983). These wells draw from depths ranging from 40 to 198 feet, while the water table is found at depths as shallow as 25 feet (see Appendix E for area well logs). The city of Crest Hill operates five municipal wells that draw from the AOC. Four of these wells are located within a 3-mile radius of the site. Water from all of the wells is blended before distribution (Djerf 1986). The city of Rockdale operates three municipal wells located within a 3-mile radius of the site. Two of these wells draw from the AOC. Water from the three wells is blended prior to distribution (Duffield 1988). Two subdivisions, Ridgewood and Ingall's Park, located on the east side of the city of Joliet, also operate wells that draw from the AOC within a 3-mile radius of the site (Woller and Sanderson 1983). The city of Joliet operates five municipal wells that draw from the AOC; however, these wells are all located outside of the 3-mile radius (Duffield 1988; Woller and Sanderson 1983). The closest well to the site drawing from the AOC is a private residential well approximately 1 mile east of the site (United States Geological Survey [USGS] 1953, 1954, 1962, 1963).

A majority of the municipal wells operated by the city of Joliet (a total of approximately 16) draw from the Cambrian-Ordovician aquifer, and six of these wells are located within a 3-mile radius of the site. The Joliet Correctional Center and the Statesville Correctional Center both operate wells that are located within a 3-mile radius of the site and draw from the Cambrian-Ordovician aquifer (Woller and Sanderson 1983). The city of Lockport also operates municipal wells that draw from the Cambrian-Ordovician aquifer and are all located outside of the 3-mile radius (McCluskey 1986).

Targets within a 3-mile radius of the site potentially affected by TCL compounds and TAL analytes in the AOC include a total of approximately 15,500 persons. This population figure was calculated by adding the people served by the Crest Hill municipal water system

(approximately 7,500), the Rockdale municipal water system (approximately 1,900), the Ridgewood Subdivision water system (approximately 300), and the Ingall's Park Subdivision water system (approximately 800), to the approximately 5,000 persons who draw water from private residential wells within a 3-mile radius of the site. The population using private residential wells was calculated based on USGS topographic maps of the area that indicate that approximately 1,650 homes with private wells are located within the 3-mile radius of the site (USGS 1953, 1954, 1962, 1963). Using a figure of 3.07 persons per household for Will County (U.S. Bureau of the Census 1982), multiplied by the approximately 1,650 homes, the population of approximately 5,000 was calculated.

5.3 SURFACE WATER

Surface water and sediment samples that could show an observed release to surface water near the USSJW site were not collected. Attribution to the site would be difficult to prove at the SSI stage because of the degraded water quality of the surface water bodies nearest the site, I & M Canal and the Des Plaines River, which border the site on the west.

A high potential exists for TCL compounds and TAL analytes detected in on-site soil/sediment samples to migrate off-site into the Des Plaines River or I & M Canal for the following reasons.

- TCL compounds were detected in sediment samples collected from an on-site ditch that leads to the Des Plaines River (S5), and from near the WTP outfall (S6), at concentrations above the background concentration.
- TAL analytes were detected in elevated concentrations in all on-site soil/sediment samples.
- An approximately 10% slope is found along the west boundary of the site, which adjoins I & M Canal and the Des Plaines River.

Surface water is not used for drinking water in the area of the site. The Des Plaines River and I & M Canal are used recreationally for fishing in the area (Mathews 1989).

5.4 AIR

A release of TCL compounds or TAL analytes to the air was not documented during the SSI of the USSJW site. During the reconnaissance inspection, FIT site-entry instruments (OVA 128, hydrogen cyanide detector, and radiation detector) did not detect levels above background concentrations at the site. In accordance with the U.S. EPA-approved work plan, further air monitoring was not conducted by FIT.

A potential does exist for TCL compounds and TAL analytes to migrate from the site via windblown particulates. This potential is based on the following information. TCL compounds and TAL analytes were detected in on-site soil samples collected in areas lacking any vegetative cover.

The target population within a 4-mile radius of the site is approximately 102,000 persons. This population was calculated in the same manner as described in Subsection 5.2

5.5 FIRE AND EXPLOSION

During the SSI of the USSJW site, FIT observations and monitoring equipment readings (explosimeter and oxygen meter) indicated that no apparent potential for fire or explosion existed on-site. File information indicates that there has been no observed incident of fire or explosion on-site in the past.

5.6 DIRECT CONTACT

According to federal, state, and local file information reviewed by FIT, observations made during the SSI, and the interview with the site representatives, no incidents of direct contact with TCL compounds or TAL analytes at the USSJW site have been documented.

There is a potential that the public and on-site workers may come into contact with the TCL compounds and TAL analytes detected on-site. The potential for direct contact is based on the following information.

- TCL compounds and TAL analytes were detected in on-site surface soil/sediment samples.
- Access to the west side of the site is not restricted because this portion of the site is not completely fenced.

The population within a 1-mile radius of the site potentially affected through direct contact with TCL compounds and TAL analytes at the site is approximately 22,000 persons. This population was calculated by counting houses outside city limits within a 1-mile radius of the site on a USGS topographic map (USGS 1962) and multiplying this number by a persons-per-household value of 3.07 (U.S. Bureau of the Census 1982), and adding to this those portions of the populations of Joliet and Crest Hill within 1 mile of the site. Approximately 25% of Joliet (approximate population 80,000) and 5% of Crest Hill (approximate population 7,500) are within the 1-mile radius.

07 COMMENTS

A former drum storage area is located on site. Waste solvents were stored here before being shipped off site. It is not clear how long this practice occurred, or the quantity of waste which was stored.

IV. CONTAINMENT

01 CONTAINMENT OF WASTES (Check one)
<input checked="" type="checkbox"/> A. ADEQUATE, SECURE <input type="checkbox"/> B. MODERATE <input type="checkbox"/> C. INADEQUATE, POOR <input type="checkbox"/> D. INSECURE, UNSOUND, DANGEROUS

02 DESCRIPTION OF DRUMS, DRUMS, LINERS, BARRIERS, ETC.

See Narrative Section 3.

V. ACCESSIBILITY

01 WASTE EASILY ACCESSIBLE: ☒ YES ☐ NO

02 COMMENTS TCL compounds and TAL analytes were detected in on-site surface soil and sediment samples and the perimeter of the site is not completely fenced.

VI. SOURCES OF INFORMATION (Cite specific references, e.g., state files, sample analyses, reports)
